

EVAPORATIVE EMISSIONS CANISTER ASSEMBLY AND APPARATUS

ABSTRACT

A canister for an evaporative emissions control system that comprises a
5 canister package with an interchangeable cartridge. The specific cartridge selected
for use in the canister package is determined primarily based upon emissions
regulatory requirements of the device that uses the canister. The need for a
common canister package with an interchangeable cartridge simplifies packaging
and assembly of the canister into any device, whether a vehicle or a stationary
10 device, or a handheld tool. For example, a common canister package reduces need
for testing, development and certification associated with use of multiple canister
packages on a common vehicle platform.
